

Dear John,

I love you! So some things that I have been thinking about lately. Did I tell you about my dream in 2018 where the Apocalypse happened right after the President visited with the President of China? Well that just happened for the first time since my dream in 2018, but nothing has happened. The missile which hit Poland was just a Ukrainian missile.

I just had an interesting dream last night, where a voice told me that since I had stopped wondering what my divine name is, that I was finally worthy to receive it; and then it said that it is Manvantarah. I felt joyful to know it and full of peace, the only problem is that upon awaking I remembered that "Manvantara" is a Sanskrit word meaning "Age" or "Epoch." For instance, in Hinduism there are 1000 Manvantaras to one Yuga, such as the Kali Yuga. So was my brain simply remembering the word, or is it just a coincidence? I don't know.

The other thing that I have been thinking about is how to Terraform Jovian moons. That is quite the task as they only receive about 2% of the Sunlight that we receive, so the Sun cannot be your heat source there. There is plenty of geothermal energy on Io and Europa though; but Io has no water to speak of and Europa is totally covered in water ice hundreds of miles thick. So I thought of an ingenious solution! -Maybe. Put a nuclear powered rail gun on Europa which can launch building sized ice cubes at escape velocities, directly at Io. That way you cover Io's volcanos in water helping it obtain an atmosphere and cooler temperatures, and at the same time get down closer to Europa's liquid water, at the bottom of your huge quarry. You would have to live on the sides of Io and Europa, which never see Jupiter however, as Jupiter puts off significant amounts of Radiation. The one moon which doesn't have that problem, and which, upon, you could have Jupiter out your front window, is the moon Ganymead. -because it has its own Magnetic field. Amazingly, Ganymead is the only small rocky body with its own complete magnetiz field besides the earth, which makes it very special in my mind; but it doesn't have enough geothermal to heat the planet as a whole biom. So maybe we should just make nuclear powered bases on Ganymead and call it good, I don't know. -But I think going to Mars is totally stupid. Why would you move to a planet where you have to shelter from solar storms every other day? -That's nonsense! The back sides of Io, Europa, and Calisto are protected by Jupiter's own magnetic field, and Ganymead is protected by both Jupiter's and its own magnetic fields. -And Ganymead's front is protected from Jupiter by its own magnetic field. So Ganymead is the most magneticall protected planet in the Solar-system.

So anyway that's all I was thinking about. I am doing good and feeling much improved! I think Refinement is enjoying day to day here long term, and I am feeling so good day to day now. I am much more content now, and I am comfortable with the things I receive. I love you Eternally!
